Browser v0.2 false-interruption policy

Same URL model and thresholds • warning becomes passive • only strict block interrupts

Cohort	Legitimate	v0.1 false blocks	v0.2 false blocks	Avoided	v0.1 phish blocks	v0.2 phish blocks
Primary 30K	28,500	88	6	82	1,176	564
Long-URL stress	2,000	22	0	22	147	92

What changed

- High-risk warning badges remain visible, but they no longer replace the requested page.
- Only the already calibrated strictest tier opens an interstitial.
- Exact-host trust is explicit, local, reversible, and never applies automatically to subdomains.

Diagnostic only: these previously evaluated datasets were not used to change model scores or thresholds.
